News and Developments

- Bentley Plant
 - OpenPlant

What is OpenPlant?

- OpenPlant is open software designed for the distributed world
- OpenPlant lets engineers quickly access and share data, facilitating collaboration in an open environment
- OpenPlant provides complete, consistent and correct data throughout the plant lifecycle
- OpenPlant stimulates innovation by delivering greater flexibility, adaptability and productivity
- OpenPlant software uses ISO 15926 as the native storage format for application content

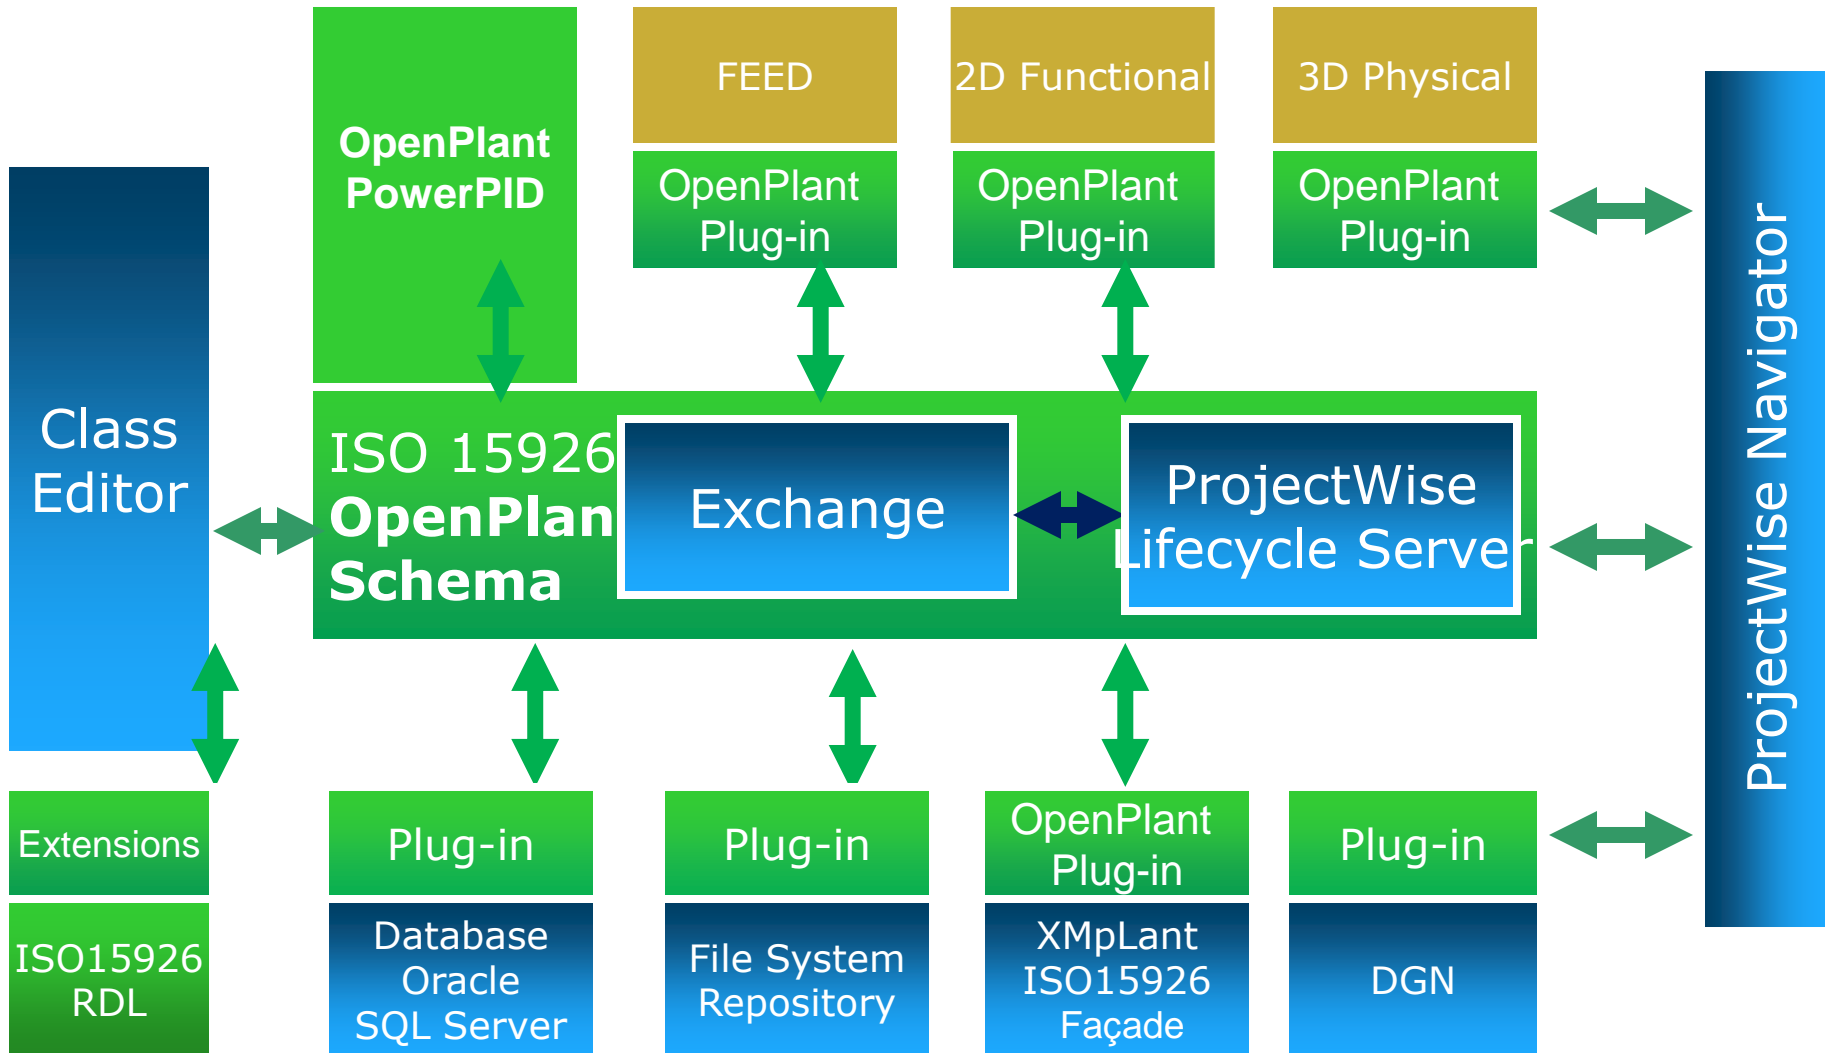

What is ISO 15926?

- ISO 15926 is an International Standard for the exchange of process plant life-cycle information.
- It is also an excellent data model for *persistence* of plant data

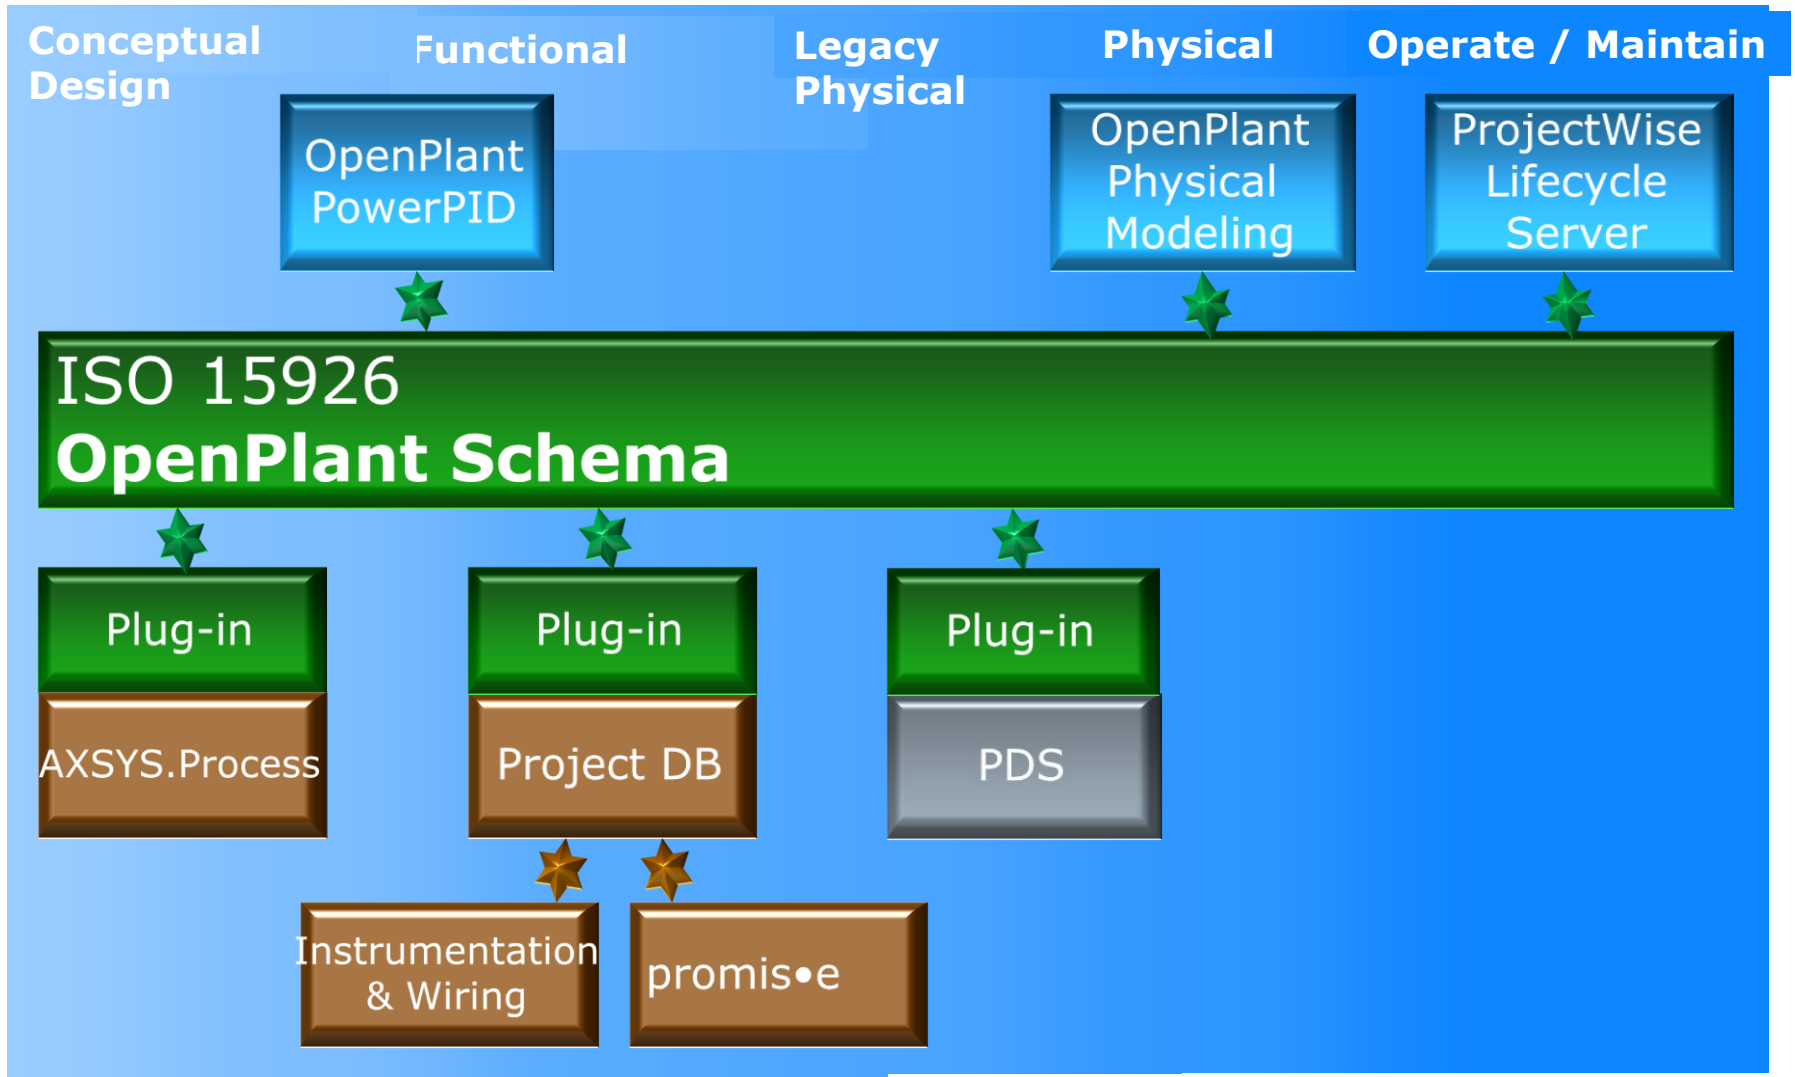

Who develops ISO 15926?

- FIATECH Members – including owners, contractors, equipment suppliers, and software providers are working together with the POSC Caesar Association and DNV, to create ISO 15926 online reference data library.
- FIATECH is an industry consortium that provides global leadership in identifying and accelerating the development, demonstration, and deployment of fully integrated and automated technologies to deliver the highest business value throughout the lifecycle of all types of capital projects. www.fiatech.org.
- POSC Caesar is a global, nonprofit organization that promotes the development of open specifications to be used as standards for enabling the interoperability of data, software, and related matters.

News and Developments

- Bentley Plant
 - OpenPlant
 - ConstructSim

What is ConstructSim?

- A true “construction simulation” tool
 - Brings together all data used for construction execution and project controls into a single “Virtual Plant Model” (VPM)
 - “Work packaging” – allows users to automate a detailed execution plan, broken down week by week for
 - Fabrication
 - Erection
 - Testing
 - Turnover
 - Commissioning
 - “Work facing” – reorganises design information into multiple construction views covering the work breakdown of tasks, materials, resources, construction planning and phasing
- This is what we mean by “construction simulation”

What ConstructSim is NOT...

- Not a design visualization tool
 - Utilizes visualization engines as a presentation layer
 - Visualization tools only aggregate design geometry
 - ConstructSim adds geometry from non-geometric design systems and provides a graphic representation (e.g. welds from piping isometrics)
- Not simply a schedule simulation tool
 - Schedule simulation tools are mostly time-based (e.g. 4D)
 - ConstructSim provides construction simulations along a number of axes (e.g. time, tasks, materials, resources, costs)
- Not limited to just the design information
 - Supports construction resources and sequencing of items like scaffolding, onsite material management and crane utilization
- It is a mistake to even compare ConstructSim to Navisworks or even Bentley Navigator

Current Major Issues in Construction

- Poor communication between crafts and functions
- Concurrent engineering
 - Design and construction going on in parallel
- Availability of drawings from engineering
- Materials availability
- Allocation of materials
- Spool delivery from fabrication
- Short time between IFC / AFC and construction

Current Major Issues in Construction

- Fast track projects – pressure on schedule
- Limited resources
- Ageing skilled workforce
 - Younger – less experienced craft people
- Many revisions during the project
- Schedule by area – turnover by systems
- Tendency to work with whatever is available
- Operating in “Scramble mode” to try and achieve schedule.

Overview

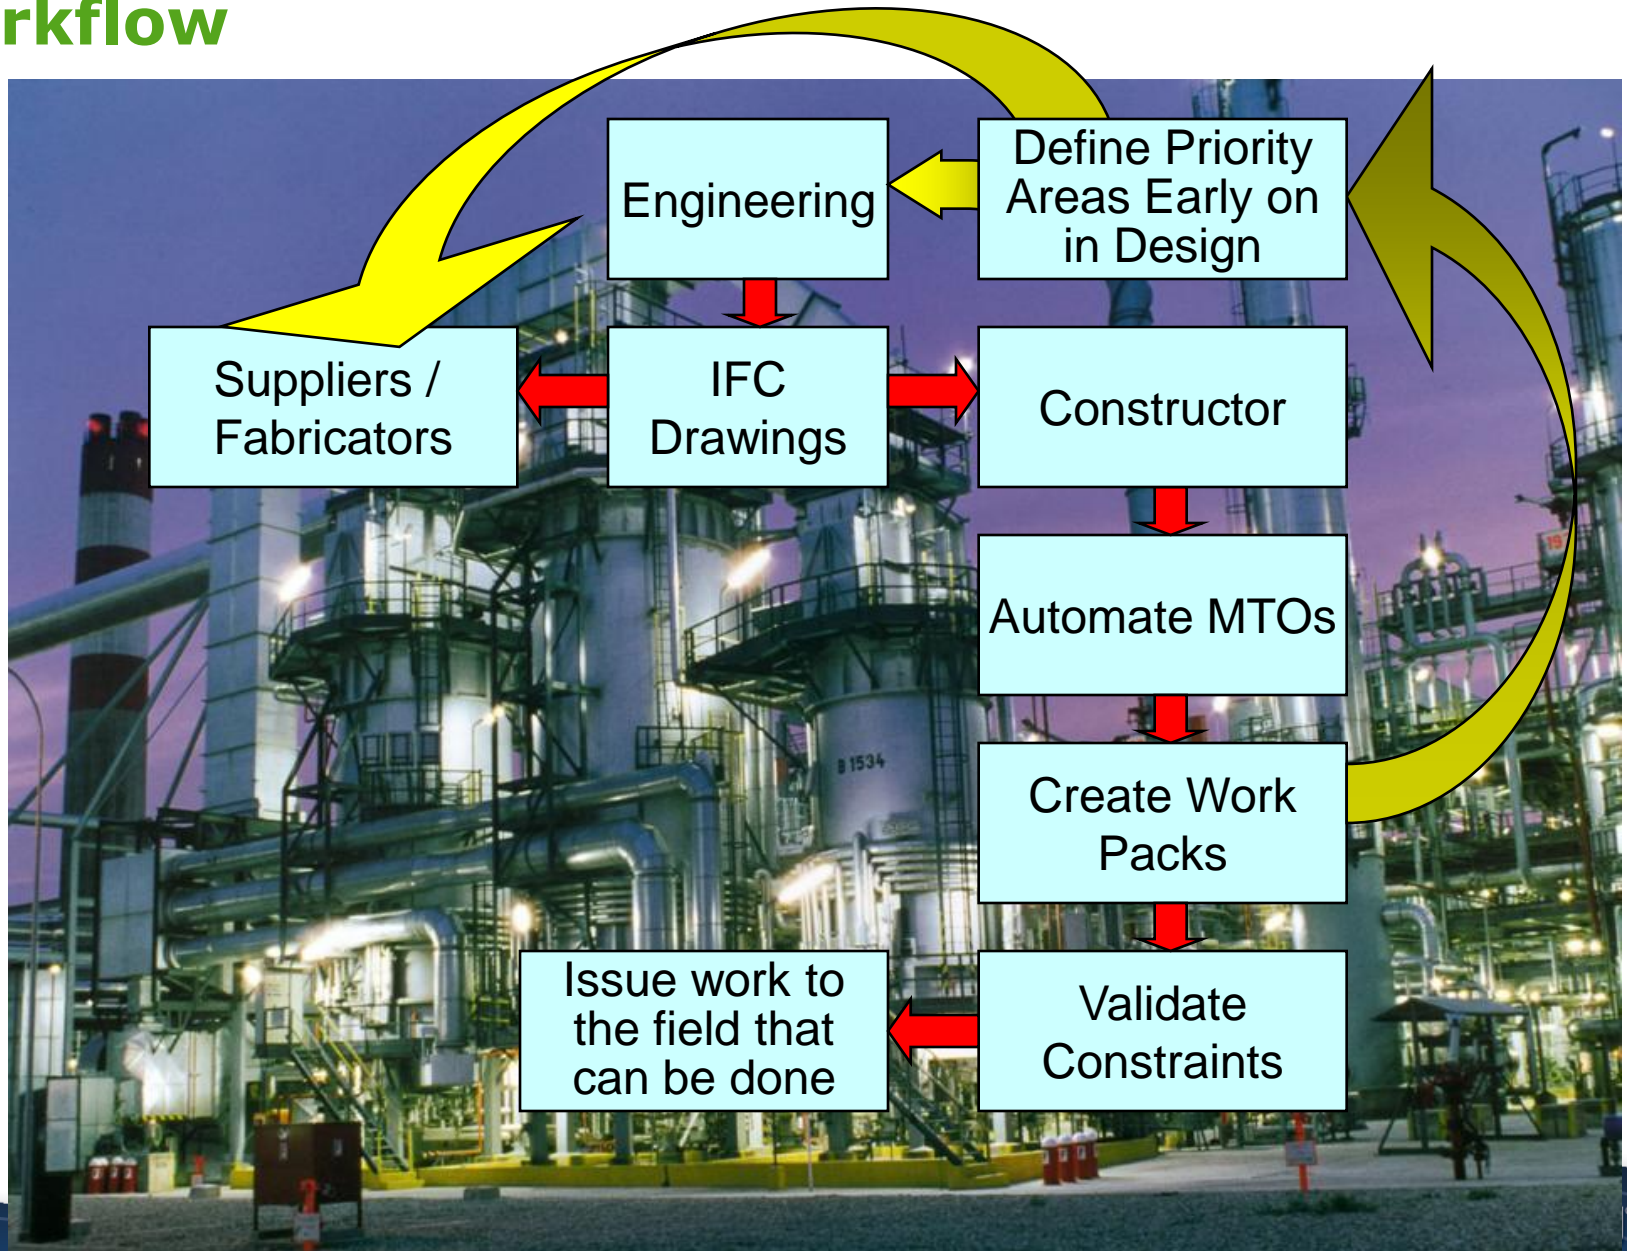

Work Process Methodology

Software Technology

Workflow

ConstructSim in Action (1)

Organization By Project Areas

Automatically synchronize ConstructSim with the project schedule. Re-organize materials components by craft disciplines, material specifications, as well as construction areas. Explicitly model the “parade of trades” through construction areas. Develop priority lists for scheduling and tracking materials procurement and engineering design by construction area.

ConstructSim in Action (2)

Organization By Systems

Re-organize the engineering model by "systems" for testing and turnover. Visually monitor installation progress and remaining installation tasks system-by-system. As the project transitions from "installation by areas" to "testing of systems", re-prioritize and focus the daily installation activities of your team to prepare systems for testing in the required sequence and timing.

ConstructSim in Action (3)

Material Availability

Monitor and track the procurement and fabrication process for project materials released for construction. Visualize the arrival of pipe spools on a daily basis, directing crew resources to target installations in the areas where materials are available.

ConstructSim in Action (4)

Automated Task Planning

Group pipe systems into isometric sheets and spools as delivered from the fabrication shop or procured as field materials. Import a library of task "typicals" from the project controls estimating database with associated unit rate and cost codes. Generate a Level-4 database of project steps from a Level-1 project schedule by automatically performing material "take-offs" and matching every material component with an associated set of task "typicals".

ConstructSim in Action (5)

Work Package Creation

Interactively plan in detail the ideal "grouping" of materials into work packages weeks before needing to mobilize for these activities in the field. Monitor the estimated hours for a work package and evenly distribute workload across crews. Virtually build a buffer of "optimal" work packages and control the release of "quality" work sequences to the field.

ConstructSim in Action (6)

Work Package Sequencing

Assign work packages interactively to crews and review weekly sequences of work. Validate resource constraints as well as site and equipment availability. Match material availability against work packages through trial allocations, ensuring work is not released to the field unless it can be installed.

ConstructSim in Action (7)

Construction Status Review

Visually monitor the status of construction execution and colorize the model based upon work "completed-to-date" as well as remaining work "to-be-completed". Synchronize activities within and across craft divisions, and identify dependencies not readily observable in traditional project management tools such as Gant charts and network diagrams. Readily compare planned progress vs. actual completion using a flexible time-based 4D schedule replay.

Bentley Acquires promis•e Product Line to Further Extend Electrical System Design Portfolio

*Software Addresses Need to Automate and Improve Productivity of
Control System Design and Documentation Workflows*

HOUSTON – daratechPLANT2008 – Jan. 28, 2008 – Bentley Systems, Incorporated today announced that it has acquired the global business of ECT International Inc., the leading provider of advanced computer-aided engineering design tools for electrical control systems. The company's flagship product line, promis•e, is an intelligent, easy-to-use software solution that generates electrical system schematics and supporting documentation, reducing electrical design time by more than 30 percent. The software, which runs on MicroStation, MicroStation PowerDraft, and AutoCAD, also makes the electrical design process more efficient and accurate, and supports more than two million

promis•e – Completing our Portfolio

- Power and control schematic diagrams (ladder wiring diagrams)
- Electrical elevation diagrams (MCC and switchgear line-ups/layouts)
- Cable and conduit schedules
- Single line diagrams for electrical and fluid power
- Raceway diagrams and shortest-distance analysis.
- Marshalling, cable, and raceway diagrams (graphical)
- Control panel layout drawings with bills of material (i.e., all the components required to physically construct the control panel)
- Programmable logic controller I/O configuration and layouts with reports
- Device nameplate and wire label reports

promis•e 2007 - Design Software With The Logical Edge

Most companies use mechanical design software as a tool to model manufactured goods, vehicles, machines, and other material objects on a computer screen. In many cases the electrical portion of the design process was a second thought and companies used the same software to manually layout the electrical schematics for these products. This method is very time consuming and can lead to many errors in the electrical design process.

Now there is a software product made specifically for the design of electrical systems that addresses engineering concerns as well as drafting tasks. This product is called **promis•e 2007**. To the standard drafting functions, **promis•e 2007** adds powerful logical functions – intelligence that automates many formerly time-consuming operations. In addition, **promis•e 2007** is project-based, allowing you to easily manage all of your electrical documentation for a project.

promis•e 2007 Benefits:

- Reduced drafting time
- Fewer drafting errors
- Faster reaction to changes
- Reduced documentation time
- Reduced start-up time
- Reduced down time
- Develop and adhere to company standards
- Available symbol libraries and parts databases with thousands of entries
- Re-use (import) existing legacy drawings and database data
- Knowledgeable, accessible technical support
- Customizable formats for drawings, reports, dialogs, etc.

Flexible Project Storage

Project Manager – Intuitive file management which centralizes project and page management features by combining Microsoft Windows® commands with **promis•e** commands. All projects and page management features are accessible from this interface along with many other features. You can create, modify and organize your projects and pages using the pull-down menus, right-click menus and toolbars.

By streamlining the user interface, you do not need to retrain on basic file management commands. Project and Page Management can be accomplished with Microsoft Windows file commands.
