

The Power of Constraints in Template Creation

Joe Waxmonsky, PE
InRoads Product Manager

This presentation will cover:

- Constraint types
- Best approaches for constraint application
- Systematic approach to applying constraints to a complex component
- Parametric constraints
- Interaction between constraints and external controls

Constraint Types

- Single Parent
 - Horizontal, Vertical, Slope
- Two Parent
 - Horizontal Min, Horizontal Max, Vertical Min, Vertical Max
 - Vector-Offset
 - Angle-Distance
- Project to Surface
- Project to Design
- Style

Single Parent Constraint Types

- Location of point is determined by constraining the point to its parent by the distance or slope specified in the constraint.

Horizontal
Constraint
Symbol

Two Parent Constraint Types

- Max/Min constraints
 - Takes the parent with the lowest coordinate value (Min) or highest coordinate value (Max) and applies a single parent constraint from that controlling parent.

Horizontal Maximum Constraint

The Parent point with the highest(maximum) X coordinate value is the controlling parent.

Two Parent Constraint Types

- Vector-Offset constraint
 - The two parent points define the vector, and the offset is measured perpendicular from that vector.

Vector Offset Constraint

Parent 2

Parent 1

Offset value measured perpendicular to vector. Positive value is to the right of the

Vector defined by parents

Two Parent Constraint Types

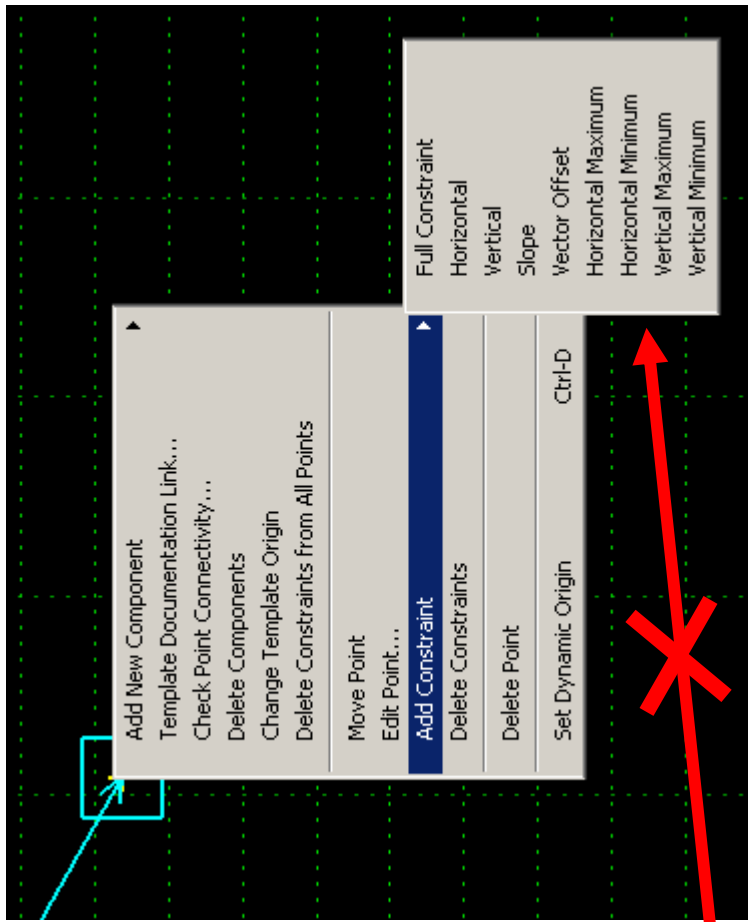

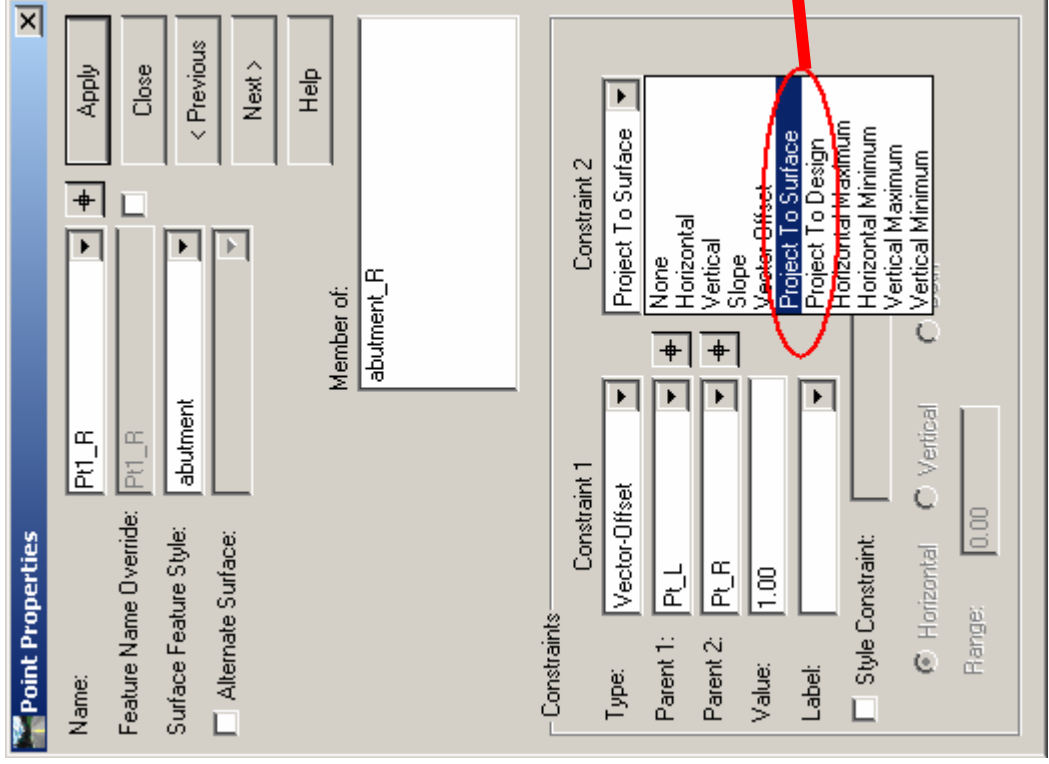

- Angle-Distance constraint
 - The two parent points define a baseline direction. The angle is relative to the baseline, and the distance is along the vector define by the angle. This constraint allows for rigid body rotation of the vector, and the offset is measured perpendicular from that vector.
 - An angle distance constraint fully constrains a point.

Angle Distance Constraint

Projection Constraints

- Requires another constraint to determine projection direction.
- Project to Surface constraint projects to an existing surface.
 - Athens Honors this with Target Aliasing
- Project to Design constraint projects to the nearest end condition component of the template.

Partially Constrained Points

- Points that only have one point are said to be partially constrained.
- Behavior is dependent on the type of constraint applied.
- To avoid unpredictable results, it is best to fully constrain a point whenever possible.

Best approaches for constraint application

- Typical road component
 - Up and then to the middle

Typical Pavement Component

Best approaches for constraint application

- Solid object
 - All constrained to the first point
 - Depends on how it is to be used
 - Parametric constraints
 - External controls

Complex Component Example

- Steps
 1. Determine points that move together and constrain them as rigid bodies
 2. Determine variable relationships and constrain them appropriately.

Parametric constraints

- What are parametric constraints?
 - Standard constraints with a parametric label
 - Can be changed along a corridor
- What are some applications?
 - As transitions for road widening
 - As switches for template changes
 - To change pavement thickness

Point Properties

Name: TopOfSubgrade_C

Feature Name Override: TopOfSubgrade_C

Surface Feature Style: Asphalt

Alternate Surface:

Member of:
Subgrade
Top Paving

Constraints

Constraint 1	Constraint 2
Type: Vertical	Horizontal
Parent 1: CenterLine	CenterLine
Value: 0.17	0.00
Label: >1=Urban Left Lane Width Pave Thick Right Lane Width	Both
Range: 0.00	

Buttons: Apply, Close, < Previous, Next >, Help

Parametric Constraints

Corridor: Parametric Constraint Demo

Station Limits
Start: 100+00.00
Stop: 153+68.93

Constraint Label: Pave Thick

Start Value: -0.25

Stop Value: -0.25

Override Values:

Name	Start Value	Stop Value	Start Station	Stop Station
Left Lane Width	-15.00	-30.00	120+00.00	125+00.00
Left Lane Width	-30.00	-30.00	125+00.00	153+68.93
Right Lane Width	15.00	30.00	120+00.00	125+00.00
Right Lane Width	30.00	30.00	125+00.00	153+68.93
>1=Urban	2.00	2.00	130+50.00	153+68.93
Pave Thick	-0.25	-0.25	100+00.00	153+68.93

Buttons: Add, Close, Change, Help, Delete

Interaction between constraints and external controls

- How are point coordinates determined?
- When an external control is applied, what happens to the point constraints?

How are point coordinates determined?

- Order of processing (from highest to lowest)
 1. External control
 2. Style constraint
 3. Point constraint
 4. Location as drawn

What happens when an external control is applied?

- If the control is both horizontal and vertical then all constraints are deleted because the control fully defines the point location.
- If the control is only horizontal or only vertical, then one constraint will be deleted.
- Which constraint is deleted?
 - The constraint deleted is the one that most closely matches the external control.
 - If there is ambiguity about which constraint is most like the control, then the second constraint is deleted.

Style Constraint

- Similar to a Point Control.
- Overrides Horizontal and/or Vertical constraints on a point.
- Applied when:
 1. A feature or horizontal alignment is found in the active surface or geometry project that has the specified style.
 2. The feature or alignment with the matching style intersects the cross section within the horizontal distance specified.

The screenshot shows the 'Point Properties' dialog box. The 'Name' field is 'LO_EOP'. The 'Feature Name Override' is 'LO_EOP'. The 'Surface Feature Style' is 'EOP'. The 'Alternate Surface' checkbox is unchecked. The 'Member of' list includes 'L_Top Paving', 'LO_Curb_R', and 'Top Paving'. The 'Constraints' section has two columns: 'Constraint 1' and 'Constraint 2'. 'Constraint 1' has Type: Horizontal, Parent 1: Centerline, Value: -29.50, and Label: (empty). 'Constraint 2' has Type: Slope, Parent 1: Centerline, Value: 2.000%, and Label: (empty). The 'Style Constraint' checkbox is checked, set to 'EOP'. Below it are radio buttons for 'Horizontal' (selected), 'Vertical', and 'Both'. The 'Range' field is '-50.00'. A red circle highlights the 'Style Constraint' section.

Project to Surface / Project to Design constraints

- The “Project to Surface” and “Project to Design” are special constraints.
- They need one other constraint on the point to determine the projection vector.
- The only place they can be applied is in the Point Properties dialog.

Project to Surface Test Case

Summary

- Normal constraints can be used to create templates that solve complex problems
- Parametric constraints and style constraints can be used to modify the behavior of templates in a roadway design file.
- The combination of constraints, along with display rules, can be used to significantly reduce the number of templates required to design a road.

Questions ?

- Hands on experience with point constraints:
- WS26 – Exploring Template Points and Constraints (InRoads/GEOPAK)
